# Frosthaven Mods

Mod guide · version 1.1.0 · what each mod does and how to use it

> **The short version:** everyone installs the same version of the mods. The host turns on the mods the group wants in **Options > Custom Rules**. Everything else happens in the game as usual.

## Installing and updating

1. Close Frosthaven.
2. Download **Frosthaven-Companion-<version>.zip** from the latest release and unzip it anywhere: github.com/Kalarian/Frosthaven-Mods/releases/latest
3. Run **Frosthaven Companion.exe** and click **Install** in its Mods tab. If Windows warns you, click **More info**, then **Run anyway**.
4. When a new version is out, the Mods tab says so: click **Update the app**, then **Update**.

**Everyone in a co-op game must have the same version.** The game won't stop you from joining with a different one; instead, things go out of sync partway through a scenario. If you're not sure, everyone opens the companion before you play: its Mods tab shows the installed version.

To remove the mods, click **Remove the mods** in the companion's Mods tab. Your saves are never changed, and a campaign played with the mods still loads without them. The one exception is a campaign that has used a Gloomhaven class (see **Content packs**): it needs the mods for good.

## Turning mods on and off

- Every mod is a switch in **Options > Custom Rules** while a campaign is loaded. All of them start off, except **Stacking attack bonuses**, which restores an official rule and starts on.
- The **host** decides. The switches are saved with the campaign and sent to everyone who joins.
- You can change them at any time in the outpost. Mods that change how scenarios play can't be changed during an online scenario (the switch says so); change them back in the outpost.

| MOD | IN ONE LINE | CHANGES THE GAME? | STARTS |
|---|---|---|---|
| Tradeable resources and equipment | Give gold, materials and items to another character | Yes | Off |
| Share duplicate loot | A second copy of an item you loot goes to someone else instead of being sold | Yes | Off |
| Easier item reward window | Handing out item rewards takes fewer clicks | No | Off |
| Reveal event outcomes | See what each event choice will do before you pick it | Yes (information) | Off |
| Show personal quest rewards | Quest cards show the building each quest unlocks when you retire | No | Off |
| Reduced randomness | No nulls or x2s in modifier decks: a -2 and a +2 instead | Yes | Off |
| Stacking attack bonuses | Every +X Attack bonus on an attack adds up, as in the board game | Yes (official rule) | **On** |

| | | | |
|---|---|---|---|
| Masteries carry over | A mastery earned once counts for every later character of that class | Yes | Off |
| Dwarf's balance changes | A few fixes to the campaign's rough spots, from a well-known player | Yes | Off |
| More story events | Town events that unlock something come up more often | Yes | Off |
| Game bug fixes | Fixes bugs in the game itself | Yes (bug fixes) | Off |
| Milestone saves | Automatic backup saves you can go back to | No | Off |
| Battle stats | Lots more stats after each scenario, and campaign totals | No | Off |
| Modifier deck odds | Shows the odds of your next attack modifier draw | No | Off |
| Scenario map file | Saves your progress for the scenario map page | No | Off |
| Gloomhaven classes (1st edition) [WIP] | Content pack: the 21 classes of Gloomhaven and Jaws of the Lion | Yes (new classes) | Off |
| Gloomhaven classes (2nd edition) [WIP] | Content pack: the 17 classes of Gloomhaven's second edition (not together with the 1st edition) | Yes (new classes) | Off |
| Gloomhaven classes: all open at once | With a Gloomhaven pack: every class open at once instead of one per retirement | No | Off |

## The mods

### Tradeable resources and equipment changes the game

Pass gold, lumber, metal, hide and items between characters in the party. Normally each character keeps their own.

**HOW TO USE**

- In the outpost, hold Ctrl and click the portrait of one of *your* characters in the party column on the left, or click the **GIVE** button under their name at the top.
- **Resources** tab: each column is another party member. Click a cell to give 1, right-click to take 1 back, Ctrl+click for 10, Shift+click for everything (or nothing).
- **Items** tab: click the cell under the person who should get the item.
- Nothing happens until you press **Give**. Esc closes the window without giving.

**GOOD TO KNOW**

- Herbs aren't in it: the game already keeps herbs in one shared supply.
- Nobody can own two copies of the same item, so someone who already has it can't be picked.
- Gold and materials can also go to a character being created. Items go to party members only.

### Share duplicate loot changes the game

When you loot an item you already own, the game normally sells it on the spot. With this on, the party decides who gets it, which is the board game's rule.

**HOW TO USE**

- Nothing to do during the scenario. Back in the outpost, the usual item reward window opens: pick who gets it.
- If nobody else in the party can take it, it's sold as usual. To sell it anyway, the new owner sells it in the shop for the same gold.

### Easier item reward window convenience

The window that hands out item rewards (from events, quests and shared duplicate loot) is quicker to use.

- It opens with nothing assigned, so you choose who gets each item instead of undoing the game's guess.
- Left-clicking another character moves an item to them in one click.
- Every item still has to go to someone before **Done**.

### Reveal event outcomes shows hidden information

On town, road and boat events, hover over an option to see what it will do before you choose: the outcome story text, then its effects for your party (gold, damage, morale, items, an outpost attack, choices you'll be asked to make).

- When an outcome depends on a random roll, it shows the roll you would actually get.

### Show personal quest rewards no gameplay change

When a new character picks one of two personal quests, each card shows the building that quest unlocks when the character retires, like the board game's quest cards do.

- It also shows what you'd get instead if someone unlocks that building first.
- If another party member's quest would unlock the same building, it says so: whoever retires second gets the other building.
- The extra quest you can draw with 15 inspiration when retiring shows it too.

### Masteries carry over changes the game

Once a character earns a mastery, every later character of that class starts with that mastery already done, and gets its perk mark when created. No more re-doing the same awkward challenge for each new character of a class.

- Only masteries earned while this rule is on count.
- A carried mastery can't be earned a second time by the new character.
- Masteries are still only earned in scenarios you win, as usual.

### Reduced randomness changes the game

Gloomhaven digital's house rule, which Frosthaven carries but never offers. Every attack modifier deck, yours and the monsters', swaps the null for a **-2** and the x2 for a **+2**. Both still reshuffle the deck at the end of the round. Curses become -2 and blesses +2. Fights get steadier: no wasted attacks, no huge spikes, for you or for them.

- Takes effect when the next scenario starts. It can't be changed during an online scenario.
- Perks work as usual. One that removes a -2 takes the plain -2 and leaves the reshuffling one, just as it leaves the null in the normal deck.

### Stacking attack bonuses changes the game

The official rule of the physical game (rulebook p.25): every bonus that applies to an attack adds up. The digital game already adds almost every bonus (a +1 from one card and a +2 from another give **+3**); it keeps only the largest of the bonuses written for "your default attack". This switch makes those add up too.

- **On by default**, in new and existing campaigns. The host can switch it off to get the digital game's rule back.
- Of Frosthaven's cards only the Versatile Dagger's bonus is a "default attack" bonus, so the switch rarely changes a number. Ability card bonuses (Frosthaven's classes and the Gloomhaven packs) already add up without it.
- It can't be changed during an online scenario.

## Dwarf's balance changes

changes the game

A handful of changes from Dwarf74's *Unofficial Frosthaven Campaign Tweaks*. He maintains the official FAQ and was one of the main campaign playtesters. They smooth out spots many groups find frustrating:

- **Personal quests:** once everyone has finished one, the quests that unlock the Tavern and the Stables come up first, and new quests prefer ones that still unlock something new.
- **Early Barracks:** in the first winter, with good morale, the outpost event that upgrades the Barracks comes up early.
- **Shorter waits:** personal quest 7's two waits are 5 weeks instead of 6. Personal quest 15 needs 60 gold.
- **Scenario 14** is reworked: you also have to defeat the Abael Herders, and the spawning monsters alternate rounds.
- **Boneshaper:** the first mastery (kill 15 of your own summons) can be done across several scenarios.

## More story events

changes the game

More of your weekly town events move the story along: a new scenario, a section to read later, another event, a building, an item or a quest.

- When the week's event is drawn and none of its choices could unlock anything new, it goes to the bottom of the deck and the next one is drawn instead.
- Only once a week: the second card is kept, whatever it is, so quiet weeks still happen.
- Outpost attacks are never skipped.
- Roughly half of summer weeks and a quarter of winter weeks bring something new, instead of about a third and a seventh.

## Game bug fixes

changes the game

Fixes for mistakes in the game's own code. One switch for all of them:

- **Fair shuffles:** the game's shuffle is slightly broken, which makes nulls and x2s a little more common than they should be. Attack modifier decks, the loot deck and similar draws are shuffled properly.
- **Co-op:** fixes for several things that could put players out of sync or freeze the outpost.
- **Outpost:** rebuilding doesn't cost extra morale, morale can't go below 0, the Jeweler's discount is charged as shown, the calendar shows the right week, and a few events work the way their cards say (which buildings get attacked first, cards that went missing from the town guard deck).
- **Quests and events:** personal quest 14 needs five *different* areas, and the SO-10 delivery still arrives in later years.
- **Save list:** the Load window's preview shows each hero's current level and gold. Without the fix it showed what they had when they last went on a scenario (a party levelled in the outpost read as level 1).
- **Hand management:** clicking another party member while editing a hand switches to their cards. Without the fix the screen kept the first character's cards, read-only, under the new character's name.

## Milestone saves no gameplay change

The game only keeps its last 15 autosaves, roughly the last hour or two of play. This makes a named backup at the start of every scenario and the moment the outpost opens after one (before the loot is handed out and the outpost events run), so you can go back further after a crash, a desync or a misclick.

- They appear in the normal **Load** list as *Mod backup - week 23 - scenario 14 start* or *Mod backup - week 23 - after scenario 14*.
- The newest 20 are kept. Your own saves and the game's autosaves are never touched.
- Only the host's game makes them. To go back in co-op, the host loads the backup on their own, then hosts the game again and everyone rejoins.
- Not available in Iron Man campaigns.

## Battle stats no gameplay change

After each scenario, the **Statistics** tab gets about 40 extra rows: damage, kills, healing, shields, luck with your modifier deck, cards and elements used, exploration and more. Summons count for the character who summoned them.

- The **Campaign** button at the top of the Statistics page shows each character's totals over every scenario played with this on. **This scenario** switches back.
- Each finished scenario's full battle record is saved for the **Stats** tab of the companion app (charts of the whole party's campaign: luck, damage, rounds, trends). Wins, losses and resigns count; a restarted or unfinished scenario never does, and loading an older save takes back anything after it.

## Modifier deck odds no gameplay change

In a scenario, right-click a character to open their info panel. Under Attack Modifiers (which shows how many of each card are left), it shows the odds of their next draw:

- Null, -1/-2, +0, +1 or more, x2, and the chance of a rolling bonus. Curses count as nulls and blesses as x2s (as -2 and +2 under Reduced randomness).
- Each modifier icon also has a small tag with that card's own chance.
- Right-click a monster to see the same for the monsters' deck.
- It notes when a deck will reshuffle at the end of the round. It's the same math you could do from the counts the game already shows.

## Scenario map file no gameplay change

Saves your campaign's progress (which scenarios are done, available or locked out) every time the game autosaves, for the **scenario map page**.

- The map page shows every scenario, what unlocks it, what it leads to, and which ones lock each other out, coloured by your campaign's progress.
- It also shows the choices that still matter (like which of two scenarios to play) and how many scenarios each option keeps open, so you can aim for the most scenarios in one campaign.
- **Spoilers:** the map shows every scenario's name. Ask the host for the page if you want it.

## Content packs

A content pack adds new things to the game rather than changing a rule. The mods carry one: the **Gloomhaven classes (1st edition)** pack, which adds all 17 classes from Gloomhaven and the four from Jaws of the Lion, each with their own cards, model, animations, effects, sounds and portraits, and the perks and masteries from Cephalofair's official Gloomhaven-in-Frosthaven sheets. You don't need Gloomhaven yourself: the companion brings everything. These are the first edition's classes; Gloomhaven's second edition classes are a separate pack (see **Gloomhaven classes (2nd edition)** below), and a campaign uses one or the other, not both.

- **Perks the sheets invented for Frosthaven** work as written, with two notes. The Sunkeeper's *Shielding Light* (an overflowing heal gives the ally Ward) and the Sawbones' *Revitalizing Medicine* (an ally using a Medical Pack first loses a negative condition; the worst one is removed for you) are the mods' own code. The Quartermaster's *Well Supplied* recovers up to four discarded cards once a scenario; the sheet also asks for a persistent Quartermaster card in your active area, which the mods don't check.
- **Masteries** that the game's own tracking can't express (the Scoundrel's kills next to allies, the Sunkeeper's Light every turn, the Sawbones' ally each turn and 20-damage attack, the Quartermaster's item every turn) are checked by the mods from the scenario's records. "Allies adjacent" counts characters, not summons.
- **One card plays differently:** the Quartermaster's *Catastrophic Bomb* (bottom) hits you and *all adjacent* normal enemies for 7, where Gloomhaven let you aim a small area: Frosthaven has no way to aim damage at an area. The Sawbones' Medical Packs never go in your hand; First Aid and the like hand them out.
- **Enhancing** works exactly as for Frosthaven's cards, at the Enhancer and its prices: each Gloomhaven dot became the mark a Frosthaven card has on that kind of ability (attacks and negative conditions a diamond, heals and positive conditions a diamond+, moves a circle, shields, retaliates, ranges, targets, pushes and pulls a square, areas a hex).
- **The second four** (Cragheart, Plagueherald, Nightshroud, Berserker) follow the same sheets. Their invented perks: the Cragheart's *Earthquakes* moves every enemy in a newly revealed room one hex (a controlled move, so it ends in an empty hex); the Plagueherald's *Xorn's Boon* is a once-a-scenario button in the activate bar; the Berserker's *Rapid Recovery* adds to the long-rest heal; the Nightshroud's *Empowering Night* is a once-a-scenario button used during her turn (the sheet says at the start of the scenario) that discards two cards and lets her pick and play a card with an active-bonus action from her pool. Two Nightshroud cards play a little differently: *Wings of the Night* (bottom) is a persistent toggle you switch on before an attack for its Move 2 (Frosthaven has no "before each attack" trigger), and her invisibility shows through the game's own effect. The Cragheart's obstacles are Frosthaven's rocks.
- **The other thirteen** (Spellweaver, Tinkerer, Mindthief, Summoner, Soothsinger, Doomstalker, Elementalist, Beast Tyrant and the Jaws of the Lion four) bring their Gloomhaven mechanics with them. Their summons use Gloomhaven's own models. Soothsinger *songs* and Mindthief *augments* stay in the active area as in Gloomhaven, and every figure a song reaches shows a music note on its status row. The Doomstalker's *dooms* show the Doomstalker icon on the doomed enemy. The Beast Tyrant's bear joins after the first round's card selection, as in Gloomhaven digital, and its cards say "Command:" where Gloomhaven has a banner. The Hatchet's Favorite shows as his axe icon on the marked enemy, and only the Hatchet can loot it back. A few things differ: the Tinkerer's mines are Frosthaven's ordinary traps, and an "infuse any elements" card asks for one element at a time. The Voidwarden's *Eye of the Void* (top) plays by itself once you pick the poison target: every other enemy within 3 of it attacks that target in turn, with nothing for you to click. The Red Guard's *Brilliant Aegis* perk is the mods' own code: when an enemy attacks her and Light is available, the game asks, as it does for Leather Armor, whether to consume Light for Shield 1 and attackers' disadvantage until the round ends (this attack included). The Demolitionist's *Remodeling* works after any rest, next to a wall or not.
- **"Consume an element: do this" on its own line** (the Voidwarden's Dark instead of cursing yourself, the Elementalist's *Ethereal Manifestation*, and 59 halves across both packs) is Frosthaven's own Consume step: switch the element on, then press **Confirm Action**; skip it and nothing is spent. A half that lets you spend several elements shows Frosthaven's element picker, once for each element on the board.

- **To use it:** the host turns on **Gloomhaven classes (1st edition) [WIP]** in **Options > Custom Rules**, in the outpost. The Gloomhaven classes then show up when anyone creates a new character. The host's game makes a backup save (*Mod backup - before Gloomhaven classes*) the moment it's turned on.
- **How the classes arrive:** the classes wait in **envelopes**. Each retirement in the campaign opens one: the game offers two of the still-locked Gloomhaven classes and the party picks one, on the same screen it uses for its own class choices (with one class left, it simply unlocks). The four Jaws of the Lion classes (Demolitionist, Hatchet, Red Guard, Voidwarden) open the moment the switch is on. To have every class open at once, for testing or for a party that wants the whole roster, the host turns on **Gloomhaven classes: all open at once**, the switch under the pack's; turning it off again keeps every class that has been used (one someone has a character of, playing or retired, one a retirement already unlocked, or one with enhanced cards) and puts every other class that switch opened back into the envelopes, for later retirements to deal out again. For example: the four Jaws of the Lion classes are open and a retirement unlocked the Berserker; the host turns the switch on and someone makes a Cragheart; turning it off leaves those six open and puts the other 15 back.
- **Retirement:** like every Frosthaven class, each ported class has its own retirement story, shown on the retirement screen. The reward is the class's own pair of events from Gloomhaven, an outpost event and a road event, some of which lead to further events (the Brute's caravan, the Sunkeeper's sun demons, the Sawbones' debts). Several Frosthaven classes are rewarded with events the same way. Their effects are Gloomhaven's, translated to Frosthaven's sizes (reputation becomes morale, a Gloomhaven scenario becomes a random side scenario). The four Jaws of the Lion classes had no retirement events in Gloomhaven, so they get Frosthaven-style rewards instead. As with the game's own classes, the events come with the first character of that class to retire in a campaign.
- **Codex:** each Gloomhaven class has a hero page in the codex like the Frosthaven classes (Options > Codex > Heroes): portrait, description, health table, stats, traits, all its cards, and Gloomhaven digital's own role, difficulty and play notes. It is listed openly while every class is open from the start; a class that arrives in an envelope shows as "???" until a campaign has unlocked it, the way Frosthaven's later classes do.
- **Everyone needs the same version.** Unlike the other mods, the game checks this one: a player with a different pack is turned away when joining, with a message. A player without the mods at all only sees their join window reset, so if that happens, have them open the companion and install the mods.
- **It can't be turned off once used.** As soon as someone has created a Gloomhaven character, the switch locks on. From then on that campaign must only be opened with the mods installed; without them, the game won't load it.
- **The way out, if the pack ever has to go: Copy without content packs**. In the outpost it is in **Save Game** (host only); in the main menu it appears in **Load game** on any campaign that carries pack content, even one the game can no longer open because its pack is gone. It needs the mods installed, not the pack. It saves a new campaign, *<your campaign> (no content packs)*, that loads in a game without the pack or without the mods at all: no Gloomhaven characters (their items go back to the shop, their gold and resources are lost), none of the pack's unlocks, enhancements, retirement stories or events, and only the game's own house rules. Your real campaign is not touched. The copy is checked twice before it is offered, and the button refuses rather than writing a copy that might not load. Loading a save whose pack is missing is also stopped with the same offer, instead of failing inside the game (which would move the save to its corrupted folder).
- **Still a work in progress** (hence the **[WIP]** on the switch): every class plays in full, but some of their visual effects are stand-ins until a visual pass. What hasn't been played by a person yet, and where a class works differently from Gloomhaven, is in the table at the end of this section.
- **Looks and sounds:** his model, animations (roars included), sounds and ability effects (the shout rings, the earthquake wave, his heal and power-up glows) come from Gloomhaven, the effects redrawn with Frosthaven's own effect shaders; hits, footsteps and weapon trails are Frosthaven's. His alternative look from Gloomhaven, *Boneguard*, is picked per character with the **Skin** button under his name on his character sheet (the player who controls him picks; everyone sees it). His cards look like Frosthaven's own (banner, framed halves in his blue, the initiative hex, icons with numbers), but every card shares one banner picture of him, as Gloomhaven's cards never had paintings.

## Not tested yet, or not quite Gloomhaven

Everything in the pack has been played by the test bot, and most of it by people too. These are the things only the bot has seen, the ones nobody has managed to set up yet, and the places where a class knowingly works a little differently from Gloomhaven. If you play one of them, tell Kalarian how it went.

| WHAT | STATUS | WHAT TO EXPECT |
|---|---|---|
| Hatchet, *Fearsome Efficiency* (top) | Not played yet | An overkill passes the leftover damage to an enemy next to the target |
| Demolitionist, *Explosive Blitz* (bottom) | Only played by the bot | Opening a door with the move stuns the enemies in the new room |
| Demolitionist, *Micro Missiles* (bottom) | Only played by the bot | An object with hit points in range takes 3 damage |
| Doomstalker, *Lead to Slaughter* (bottom) | Fixed, then only played by the bot | The dooms move to the new enemy and your turn ends normally (it once hung here) |
| Spellweaver, *Spirit of Doom* (top) | Not played yet | Curse; with Dark, kill the target instead |
| Soothsinger, *Shadow Puppets* (top) | Not played yet | The enemies you jump through attack another enemy |
| Beast Tyrant, *Jaws of Death*; *Rampage* (bottom) | Not played yet | As the cards say |
| Doomstalker, *Nature's Hunger* (top); *Wild Command* (top) | Not played yet | As the cards say |
| Tinkerer, *Jet Propulsion* (top) | Not played yet | As the cards say |
| Retirement events | Every kind of reward seen working; not every event played | Gloomhaven's stories, moved to Frosthaven's places (the Tavern, the harbor, the Biting Sea) |
| Co-op with the Gloomhaven classes | Played with two players | Three or four players haven't played together with the pack yet |
| Visual effects | Work in progress | Some summons and spells use stand-in effects (the Sand Devil's whirlwind, for one) |
| Hatchet's axe | Stand-in | A dropped axe shows as Frosthaven's relic (Frosthaven has no axe model) |
| Doomstalker's dooms | Stand-in | The doom marker on an enemy uses the class icon (Frosthaven has no doom art) |
| Beast Tyrant's "Command" halves | Stand-in | A "Command" tag with the bear's face where Gloomhaven's cards have a banner |
| Tinkerer's mines; "infuse any elements" cards | Works differently | Mines are Frosthaven's ordinary traps; you pick the elements one at a time |
| A few long card texts | Works differently | Gloomhaven wrote some halves as long paragraphs; they're set in smaller text to fit |

## Gloomhaven classes (2nd edition)

The second content pack adds the 17 classes of Gloomhaven's second edition: Bruiser, Cragheart, Mindthief, Silent Knife, Spellweaver, Tinkerer, Berserker, Doomstalker, Elementalist, Nightshroud, Plagueherald, Quartermaster, Sawbones, Sunkeeper, Soothsinger, Soultether and Wildfury: 503 cards. Their cards, perks and masteries play as printed, class mats included. They borrow the first edition's models, animations and sounds, so the companion installs both packs.

- **Status:** every card has been checked against the printed card and played by the test bot. The switch keeps its **[WIP]** until the pack has been played in co-op.
- **To use it:** the host turns on **Gloomhaven classes (2nd edition) [WIP]** in **Options > Custom Rules**, in the outpost. A campaign uses one edition: the switch can't go on while the 1st edition pack is on, and the other way round.
- **How the classes arrive:** the Bruiser, Cragheart, Mindthief, Silent Knife, Spellweaver and Tinkerer open at once. The others wait in envelopes, one per retirement, as the 1st edition's do, and **Gloomhaven classes: all open at once** opens them all.
- **Everything else is as above:** everyone needs the same pack, a campaign that has had one of these characters needs the pack for good, the backup save, the codex pages and **Copy without content packs** all work the same way.
- **Controlled enemies are yours to drive.** When a card makes an enemy move or attack for you (the Plagueherald's *Spread the Plague* and *Rabid Bite*, the Mindthief's controls, the Soultether's Fey Subjugator, the Berserker's *Taunting Fury*), you choose its path and its targets, as the Frosthaven rulebook says. The monster's own thinking is not used.
- **Safeguard** is a real condition. It shows on the figure's status row with the other conditions. The next negative condition the figure would gain (a curse added to its deck included) is prevented instead, and Safeguard goes. A second Safeguard adds nothing.

### The class rules you'll meet

- **Nightshroud: Invisible.** She starts each scenario Invisible and doesn't lose it at the end of her turns. While Invisible she can't attack (unless *Swallowed by Night* bottom is active) or open doors, she moves through enemies as if they were allies, and enemies may end their move in her hex: she then teleports to the closest empty hex (her player picks if several are equally close) and suffers hazardous terrain damage. At the end of each round in which she attacked, she gains Invisible. Once every other character is exhausted or has escaped, she loses it for good, so a solo Nightshroud is never Invisible.
- **Nightshroud: Tears.** Tears look like the Deathwalker's shadows. She may have two at a time; placing a third asks which one to remove. When her own move enters one of her Tears, the game offers to remove it: yes, and her Invisible goes when that move ends, so she can attack again. Some cards have a blue **Tear hex** in their area: after performing that ability she may place a Tear there.
- **Plagueherald: Plague.** Plague tokens are not a condition. An enemy holds up to 3 (shown on its status row), and his cards say what each token does. The class has 12 in all: giving a 13th first asks his player which placed token to take back. An enemy already at 3 takes no more.
- **Silent Knife: money tokens.** As the official FAQ says, money tokens are loot tokens. Every loot token she picks up counts as one of her money tokens (the number shows on her). When a card makes her place or lose one, one of her loot cards (never the random item) goes back on top of the loot deck. A placed token is a real loot token in that hex, so whoever loots it draws that card again.
- **Quartermaster: supplies and class items.** He starts each scenario with 10 supplies (the number shows on his icon, at most 50). Spending needs 10 or more: all of them go, and he may recover the targets' spent or lost items whose gold costs add up to no more than the supplies spent (one pool for all targets; only items with a printed cost). His nine class items (Sharpened Dirk to Scroll of Foresight) are a shared supply: a card hands one to a

character and it appears in their item bar. Once used it goes back to the supply at once. They need no slot and are never in the shop.

- **Tinkerer: devices.** Enhancement Field, Pernicious Fogger, Teleportation Pad and Gravity Bomb are tokens, not figures. A hex with one is still empty: figures can stop on it, be summoned there and spawn there, and monsters don't avoid it. While both Teleportation Pads are out, the two pad hexes count as next to each other for every move of the Tinkerer and their allies (never for monsters). The Gravity Bomb goes off by itself at the end of the Tinkerer's next turn.
- **Soothsinger: Notes and Songs.** She holds up to two High and two Low Notes (Shattersong's icons), gained once a round from her cards and a free one of her choice at the start of each scenario. A Song (a card marked "Song") needs the Notes printed on it: until she has them, its top is greyed out in her hand (its basic Attack 2 still works). Performing a Song removes all her Notes. Songs stack, and every figure a Song reaches shows a music note on its status row.
- **Sawbones: Medical Packs and Prescriptions.** Medical Packs never go in a hand from the outpost: his cards hand a random one to an ally in the scenario, and the ally plays it from their hand. A Prescription goes into an adjacent ally's active area and works for that ally, so it needs an ally next to him. "Remove one negative condition" asks which one when there's a choice.
- **Wildfury: the Bear.** Her Bear joins before the first round and takes its turn just before hers; she may lose cards to stop its damage, as for her own. A "Command:" half is the Bear's action, controlled by her player. *Unbreakable Bond* (bottom): for the next three rounds she picks no cards and takes no turn (she goes last for focus), and the Bear takes two full turns at initiative 14 under her control. Her other active cards keep working, but their tokens don't move.

## Not tested yet, or not quite Gloomhaven (2nd edition)

Every card of the second edition pack has been checked against the printed card and played by the test bot. What nobody has tried yet is co-op, and a few places knowingly work a little differently from the printed game. If you play it, tell Kalarian how it went.

| WHAT | STATUS | WHAT TO EXPECT |
|---|---|---|
| Co-op with the 2nd edition pack | Not played yet | As in solo play; only the bot has played the pack, always alone |
| Career masteries on a joined player's game | Not played yet | The masteries counted at the end of a scenario (the Silent Knife's, for one) are judged the same for the host and the other players |
| Spellweaver, *Etheric Bond* perk, in co-op | Not played yet | On a short rest, *Reviving Ether* comes back from the discard pile before the random card is lost, on every player's game |
| Models for the new classes and summons | Stand-in | The 2nd edition has no 3D models here: classes and summons borrow 1st edition ones (the Wildfury's Bear is the Beast Tyrant's, the Tinkerer's devices are Spirit Banner, Wind Totem, Ward and Nail Sphere models, the Doomstalker's beasts and the Soultether's spirits use similar creatures) |
| Nightshroud's Tears | Stand-in | They look like the Deathwalker's shadows. Entering a Tear because someone else pushed her doesn't offer to remove it |
| Berserker, *Bone Breaker* (bottom) | Works differently | The card stays in the active area until the scenario ends: Frosthaven has no way to drop a persistent card by hand |
| Some masteries (Bruiser damage streak, Sawbones, Soothsinger) | Works differently | Counts made during a scenario (damage streaks, songs sung) start again from zero if a save of that scenario is loaded or the game is restarted mid-scenario |

| | | |
|---|---|---|
| Sawbones, *Friend of the Oak* perk | Works differently | One free Temple blessing each outpost phase (Frosthaven's Temple). Restarting the game in the same outpost phase offers it again |
| Silent Knife, *Fence* perk | Works differently | Outpost events count as Gloomhaven's city events; road and boat events don't |
| Quartermaster, *Guild Connections* perk | Works differently | Its 2nd edition rule does nothing outside Gloomhaven (official FAQ), so here the party buys items 5 gold cheaper |

## If something goes wrong

- **"Out of sync" / desync message:** before closing the game, everyone presses Ctrl + F7. It puts a zip file on your desktop. Send it to Kalarian along with what you were doing.
- **Something got lost or went badly:** the host can load a **Mod backup** save (see Milestone saves).
- **Not sure everyone is on the same version:** everyone opens the companion. Its Mods tab shows the version installed and offers any update.

Frosthaven Mods is a fan project, not made or supported by Snapshot Games or Cephalofair.
